## CSC110 Lecture 22: Properties of Asymptotic Growth and Basic Algorithm Running Time Analysis

## Exercise 1: Properties of asymptotic growth

1. Recall the following definition:

Let  $f,g:\mathbb{N}\to\mathbb{R}^{\geq 0}$ . We can define the **sum of** f **and** g as the function  $f+g:\mathbb{N}\to\mathbb{R}^{\geq 0}$  such that

$$(f+g)(n)=f(n)+g(n), \qquad ext{for } n\in \mathbb{N}$$

For example, if f(n) = 2n and  $g(n) = n^2 + 3$ , then  $(f+g)(n) = 2n + n^2 + 3$ .

Consider the following statement:<sup>1</sup>

$$orall f,g:\mathbb{N} o\mathbb{R}^{\geq 0},\ g\in\mathcal{O}(f)\Rightarrow f+g\in\mathcal{O}(f)$$

In other words, if g is Big-O of f, then f+g is no bigger than just  $\overline{f}$  itself, asymptotically speaking.

a. Rewrite this statement by expanding the definition of Big-O (twice!). Use subscripts to help kee track of the variables. This is a good exercise in writing a complex statement in predicate logic, and will help with writing the proof in the next part.

$$\forall f,g: \mathbb{N} \to \mathbb{R}^{30}, \quad (\exists c_0, n_0 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_0 \in \mathbb{R}^t, \forall n \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_1, n_1 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_0 \in \mathbb{N}, n_0 \in \mathbb{N}, n_0 \in \mathbb{N})$$
b. Prove this statement.
$$\Rightarrow \quad (\exists c_1, n_1 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_0 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_1, n_2 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_0 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_1, n_2 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_0 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_2, n_3 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_0 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_3, n_4 \in \mathbb{R}^t, \forall n \in \mathbb{N}, n_1 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_4 \in \mathbb{N})$$

$$\Rightarrow \quad (\exists c_4, n_4 \in \mathbb{N}, n_$$

**Hint**: This is an implication, so you're going to *assume* that  $g \in \mathcal{O}(f)$ , and you want to *prove* that  $f + g \in \mathcal{O}(f)$ .

Let 
$$f,g: |N| > |R|^{2n}$$
. Assume  $\exists c_0, n_0 \in |R|^2$ ,  $\forall n \in M$ ,  $n > n_0 \Rightarrow g(n) \leq c_0 f(n)$ 

We want to prove that

 $\exists c_1, n_1 \in |R|^2$ ,  $\forall n \in M$ ,  $n > n_1 \Rightarrow (f(n) + g(n) \leq c_1 f(n))$ 

Let  $c_1 = \underline{1+c_0}$ ,  $n_1 = \underline{n_0}$  and Let  $n \in M$ .

Assume  $n \geq n_1$ .

Then, Since  $n \geq n_1$ ,  $n \geq n_0$  and if follows that  $g(n) \leq c_0 f(n)$ . Add  $f(n) \neq 0$  both sides to get  $f(n) + g(n) \leq f(n) + c_0 f(n)$ 
 $= (1+c_0) f(n)$ 

## Exercise 2: Analysing running time (for loops)

Analyse the running time of each of the following functions, in terms of their input length n. Keep in mine these three principles for doing each analysis:

- For each for loop, determine the *number of iterations* and the *number of steps per iteration*.
- When you see statements in sequence (one after the other), determine the number of steps for each statement separately, and then add them all up.
- When dealing with nested loops, start by analyzing the inner loop first (the total steps of the inner loop will influence the steps per iteration of the outer loop).

```
1. def f1(numbers: list[int]) -> None:
    for number in numbers:
        print(number * 2)
```

rough work:
. # 1 tenations is lan(numbas)

. It steps per iteration is 1. Let n be the length of the input list numbers.

Each iteration of the loop can be counted as a single step, since nothing in the loop depends on the size of the list numbers. The loop iterates in times. Hence, the total number of basic operations is n.1 and so RT (n) = n E+O(n).

```
def f2(numbers: list[int]) -> int:
    sum_so_far = 0
    for number in numbers:
        sum_so_far = sum_so_far + number

for i in range(0, 10):
        sum_so_far = sum_so_far + i * 2

return sum_so_far
```

rough work: 4 blocks to consider

assignment start 1 step

for loop:

titeration: 1

for loop:

titerations - 10

step per iteration: 1

return start 1 step

```
3. def f3(numbers: list[int]) -> None:
    for i in range(0, len(numbers) ** 2 + 5):
        for number in numbers:
            print(number * i)
```

03:

rough work: inner loop: # itérations: len & lest numbers steps per iteration: 1 outer loop: #iterations: Len(numbers) +5 Steps per iteration: Len (number).1 Formal running time analysis: Let n be the length of the list numbers. The Inner loop runs in times, and each Step is just a single step. But the inner loop is itself repeated, since it is inside another loop. The orter loop runs n'+5 times, and each of its iterations takes n.1 steps. Thus the total number of basic ophostrone is: (h2+5). N = h3 +5 n Hence RT (n) = n3+5n ED (n3).

LQZ continued Formal running time analysis: Let n be the length of the input list numbers.

The assignment and return 540 each take 1 step.

The first loop iterates in times with each iteration taking 1 step, for a total of n steps.

The Second loop iterates 10 times with each iteration taking 1 stp, for a total ob 10 steps.

Thus, the total number of basic operations is  $2 + n \cdot 1 + 10$ , so  $RT_{f2}(n) = n + 12 \in \Theta(n)$ .

## Additional exercises

Review the properties of Big-O/Omega/Theta we covered in lecture today, and try proving them! You should be able to prove all of them except (5) and (6) of the *Elementary function growth hierarchy theorem*.

 This statement is a simpler form of the more general "Sum of Functions" Theorem we saw in lecture. →
